## PYRANOINDOLE AND CARBAZOLE INHIBITORS OF COX-2

5

### **FIELD OF THE INVENTION**

This invention is in the fields of antiinflammatory and anticancer pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated disorders, such as arthritis and for treating 10 colorectal cancer.

### **BACKGROUND OF THE INVENTION**

Prostaglandins have been shown to be involved in the pathophysiology of 15 several chronic human diseases. They are involved as mediators of pain, edema and vascular permeability in arthritic diseases such as rheumatoid arthritis and osteoarthritis (Lewis and Kreft, *Immunopharmacol. Immunotoxicol.* 17, 607-663 (1995)). In addition, prostaglandins have been postulated to be involved in the pathophysiology of 20 colorectal cancer (Marcus, *New Eng. J. Med.* , 333, 656-657 (1995)). Thus an agent that inhibits prostaglandin synthesis may be useful in treating these disorders.

The biosynthesis of prostaglandins was previously thought to be due to the action of a single cyclooxygenase enzyme on arachidonic acid to afford prostaglandin H<sub>2</sub> (Vane et al., *Postgrad. Med. J.* , 66 (Suppl 4), S2-S17 (1990), Lewis and Kreft, *Immunopharmacol. Immunotoxicol.* 17, 607-663 (1995)). This intermediate is 25 subsequently transformed into the various members of the prostaglandin family by more distal enzymes. The clinical utility of cyclooxygenase inhibitors (often called NSAIDs: nonsteroidal antiinflammatory drugs) is well established in arthritic disorders (Brooks et al, *New Eng. J. Med.* , 324, 1716-1725 (1991)); however, these compounds have serious G.I. side effects due to the importance of prostaglandins in the 30 maintenance of gastrointestinal functioning and renal blood flow (Dajani et. al., *J Physiol Pharmacol.* , 46, 3-16 (1995); Somasundaram et al, *Scand. J. Gastroenterol.* , 30, 289-299 (1995)). Under the old paradigm of a single cyclooxygenase enzyme it appeared that the selective inhibition of prostaglandin synthesis in inflamed tissue 35 versus inhibition of prostaglandin synthesis in G.I tissue was unlikely unless tissue specificity could be achieved.

Recently the discovery that there are two distinct cyclooxygenase enzymes has given rise to a new paradigm which may lead to compounds that have a separation of inhibition of prostaglandin synthesis in inflamed tissue from inhibition of prostaglandin synthesis in G.I tissue (Hayllar, *Lancet*, 346, 521-522 (1995), Lewis and Kreft,

- 2 -

*Immunopharmacol. Immunotoxicol.* 17, 607-663 (1995)). In the new paradigm the constitutive cyclooxygenase enzyme responsible for prostaglandin synthesis in G.I tissue is termed COX-1 and the inducible cyclooxygenase enzyme responsible for prostaglandin synthesis in inflamed tissue is termed COX-2. Several groups have

5 reported that NSAIDS vary in their ability to inhibit COX-1 and COX-2 so that selective inhibition may be possible (O'Neill et al, *Molec. Pharmacol.* , 45, 245-254 (1994); Laneuville et al., *J. Pharmacol. Exp. Ther.* , 271, 927-934 (1994); Mitchell et al, *Proc Natl. Acad. Sci. USA* , 90, 11693-11697 (1993)). It is hoped that a selective COX-2 inhibitor would not only have clinical efficacy in inflammatory diseases but also would

10 lack G.I toxicity. There is evidence from animal models to support this hypothesis (Chan et. al., *J. Pharmacol Exp.Ther.* 274, 1531-1537 (1995); Masferrer et. al., *Proc. Natl. Acad. Sci. USA* , 91, 3228-3232 (1994); Seibert et al . *Proc. Natl. Acad. Sci. USA* , 91, 12013-12017 (1994)). Moreover, this may be the mechanism behind the improved G.I. safety of the NSAID etodolac which has a tenfold selectivity for

15 inhibition of COX-2 (Glaser et. al., *Eur. J. Pharmacol.* 281,107-111 (1995)). Thus novel COX-2 inhibitors appear as attractive targets for antiarthritic therapy with potential to reduce G.I side effects. In addition, the COX-2 enzyme has been shown to be upregulated in colorectal cancer and a selective COX-2 inhibitor may also be of use in this disease (Sano et. al., *Cancer Res.* , 55, 3785-3789 (1995)). In addition,

20 indomethacin, a relatively non-selective inhibitor of COX-2 with adverse G.I. side effects, has been shown to be useful in the treatment of Alzheimer's disease (Rogers et. al., *Neurology*, 43, 1609-1611 (1993)) which suggests that a COX-2 selective inhibitor would be not only useful for the treatment of Alzheimer's disease but also a safer therapy with fewer G.I. side effects.

25 Humber et al have described the 10 step synthesis of the 4-oxo analog of the 1,3,4,9-tetrahydropyrano[3,4-b]indole, etodolac (*J.Med. Chem.* 31, 1712-1719 (1988); U.S. Pat. No. 4,686,213). The 4-oxo metabolite was active in blocking prostaglandin synthesis and had oral in vivo antiinflammatory activity. In this invention we not only describe new analogs of this compound beyond the limited scope of U.S.

30 Patent 4,686,213 but also detail an improved 4 step synthesis for preparing this metabolite as well as previously unknown 4-imino analogs and their activity against the COX-2 enzyme.

Scheme 3

The compounds of this invention inhibit the COX-2 enzyme which is believed to be responsible for the production of high levels of prostaglandins in inflammation and colorectal cancer (Tables 1-3). It has been shown that selective inhibition of the COX-2 enzyme relative to COX-1 inhibition leads to an antiinflammatory effect without G.I. toxicity (Chan et. al., *J. Pharmacol Exp. Ther.* 274, 1531-1537 (1995); Masferrer et. al., *Proc. Natl. Acad. Sci. USA*, 91, 3228-3232 (1994); Seibert et al., *Proc. Natl. Acad. Sci. USA*, 91, 12013-12017 (1994)). Therefore, the compounds of this invention are useful for the treatment of inflammatory diseases such as rheumatoid arthritis. In addition, compounds that selectively inhibit the COX-2 enzyme are expected to have a greater margin of safety.

The compounds of this invention were evaluated for inhibition of COX-2 and COX-1 as follows: human COX-1 and COX-2 cDNAs were cloned from human monocytes, untreated and LPS treated, respectively, by RT-PCR using oligonucleotide primers based on published rhCOX-1 and rhCOX-2 sequences (Jones et al, *J. Biol. Chem.*, 268, 9049 (1993)). The cDNAs were then transfected into either Sf9 or CHO cells and subsequently converted into a microsomal preparation as described by Glaser et al (*Eur. J. Pharmacol.* 281, 107-111 (1995)). The microsomal human recombinant enzymes were diluted with buffer (100 mM Tris, pH 7.8 at 37°C) containing 0.5 mM phenol (964 µl total volume). The enzyme preparations were preincubated with vehicle (DMSO) or compounds in DMSO (1% DMSO in final assay) for 30 min at 37°C. Excess hematin was added 1 min prior to initiation of reaction (1.25 µM final hematin)

- 9 -

with 30  $\mu$ M arachidonic acid (sodium salt). Final assay volume was 1.0 ml (100 mM Tris (pH7.8), 0.5 mM phenol, 1.25  $\mu$ M hematin and 30  $\mu$ M arachidonic acid at 37°C).

The reaction was incubated for 35 s (maximum level of PGH<sub>2</sub> accumulation as determined from time course studies), and terminated by addition of 50-60  $\mu$ l of SnCl<sub>2</sub> (1 mg/ml) in 0.1 N HCl. PGH<sub>2</sub> is quantitatively converted to PGF<sub>2a</sub> by this reaction (50% efficiency of total conversion). The pH of each tube is adjusted to pH 3.0-3.5 with 1N NaOH and extracted twice with 1.5 ml of ethyl acetate (75-90% efficiency per extraction). Combined ethyl acetate layers were dried under N<sub>2</sub> (g) and redissolved in EIA buffer (2.0 ml), and PGF<sub>2a</sub> was quantified by EIA.

10 The results of the standard pharmacological test procedure described in the preceding paragraphs were as follows:

15    Based on the results shown in the tables above, the compounds of this invention demonstrated high inhibition of the human COX-2 isozyme and are therefore useful for the treatment of inflammation and inflammation-associated disorders, as an anticancer agent, and other disease states where a role for the COX-2 enzyme in producing high levels of prostaglandins has been proposed. In particular, the compounds of this invention are useful in treating arthritic disorders, such as rheumatoid arthritis; Alzheimers disease; and colorectal cancer.

20

Certain of the examples in the claims of the invention also demonstrated high selectivity for inhibition of the human COX-2 isozyme and would be expected to have a greater margin of G.I. safety, thereby facilitating patient compliance.

25

The compounds of this invention may be administered orally or parenterally, neat or in combination with conventional pharmaceutical carriers. Applicable solid carriers can include one or more substances which may also act as flavoring agents, lubricants, solubilizers, suspending agents, fillers, glidants, compression aids, binders or tablet-disintergrating agents or an encapsulating material. In powders, the carrier is a

finely divided solid which is in admixture with the finely divided active ingredient. In tablets, the active ingredient is mixed with a carrier having the necessary compression properties in suitable proportions and compacted in the shape and size desired. The powders and tablets, preferably, contain up to 99% of the active ingredient. Suitable

5 solid carriers include, for example, calcium phosphate, magnesium stearate, talc, sugars, lactose, dextrin, starch, gelatin, cellulose, methyl cellulose, sodium carboxymethyl cellulose, polyvinylpyrrolidine, low melting waxes and ion exchange resins.

10 Liquid carriers may be used in preparing solutions, suspensions, emulsions, syrups and elixirs. The active ingredient of this invention can be dissolved or suspended in a pharmaceutically acceptable liquid carrier such as water, an organic solvent, a mixture of both or pharmaceutically acceptable oils or fat. The liquid carrier can contain other suitable pharmaceutical additives such as solubilizers, emulsifiers, buffers, preservatives, sweeteners, flavoring agents, suspending agents, thickening agents, colors, viscosity regulators, stabilizers or osmo-regulators. Suitable examples of liquid carriers for oral and parenteral administration include water (particularly containing additives as above e.g. cellulose derivatives, preferably sodium carboxymethyl cellulose solution), alcohols (including monohydric alcohols and

15 polyhydric alcohols e.g. glycols) and their derivatives and oils (e.g. fractionated coconut oil and arachis oil). For parenteral administration the carrier can also be an oily ester such as ethyl oleate and isopropyl myristate. Sterile liquid carriers are used in sterile liquid form compositions for parenteral administration.

20

25 Liquid pharmaceutical compositions which are sterile solutions or suspensions can be utilized by, for example, intramuscular, intraperitoneal or subcutaneous injection. Sterile solutions can also be administered intravenously. Oral administration may be either liquid or solid composition form.

30 Preferably the pharmaceutical composition is in unit dosage form, e.g. as tablets or capsules. In such form, the composition is sub-divided in unit dose containing appropriate quantities of the active ingredient; the unit dosage forms can be packaged compositions, for example packeted powders, vials, ampoules, prefilled syringes or sachets containing liquids. The unit dosage form can be, for example, a capsule or

35 tablet itself, or it can be the appropriate number of any such compositions in package form.

- 13 -

The amount of therapeutically active compound that is administered and the dosage regimen for treating a specific arthritic disorder or colorectal cancer with the compound and/or compositions of this invention depends on a variety of factors, including the weight, age, sex, medical condition of the subject, the severity of the disease, the route and frequency of administration, and the specific compound employed, and thus may vary widely. The pharmaceutical compositions may contain active ingredient in the range of 0.1 to 2000 mg, preferably in the range of 0.5 to 500 mg and most preferably between 1 and 100 mg. Projected daily dosages of active compound are 0.01 to 100 mg/kg body weight. The daily dose of can be administered in one to four doses per day.

The following examples illustrate the preparation of representative compounds of this invention.

To a stirred solution at room temperature under nitrogen of 1-ethyl-1,3,4,9-tetrahydro-pyrano[3,4-b]indol-1-yl)-acetic acid methyl ester (Demerson et al *J.Med. Chem.* 18, 189-191 (1975), 0.271 g, 1 mmol) in 20 ml of dichloromethane-methanol mixture (9:1) was added 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (0.5 g, 2.2 mmol). After 30 min of stirring when TLC showed ~90% conversion, the mixture was diluted with water (25 ml), ethyl acetate (50 ml) and sodium sulfite (10 ml of a 10% solution). The resulting mixture was stirred for ~10 min (until substantial discoloration occurred) and diluted with 1 N NaOH solution (20 ml). Extraction with ethyl acetate (50 ml x 3) followed by evaporation of the solvent gave a light brown powder. Purification by flash chromatography (45:55 ethyl acetate:hexane) afforded 0.2 g (70 %) of the methyl ester which gave after hydrolysis (48 h, MeOH/2.5 N NaOH), 0.181 g (95 %) of the desired product as a solid, m.p. 235-238°C.

To a stirred solution of tryptophol (0.8 g, 5 mmol) and methyl 3,4-dimethoxy-10 2-butenoate (0.96 g, 6 mmol) in dichloromethane (15 ml, under inert atmosphere) in a 50 ml flask equipped with a magnetic stirrer at room temperature under nitrogen was added dropwise boron trifluoride etherate (0.15 ml, 1.22 mmol). After completion of the reaction (~2 h, monitoring by TLC), the mixture was diluted with 50 ml of dichloromethane and quenched with 50 ml of pH 7 buffer. The layers were separated 15 and the aqueous layer was washed with dichloromethane. The combined organic fractions were washed with brine and dried over sodium sulfate. Purification by flash chromatography (hexane:EtOAc= 3:1) afforded 1.15 g (80%) of colorless crystals that were subjected to hydrolysis in 40 mL of 3:1 mixture MeOH: 1 N NaOH. After the reaction was complete (24 h., monitored by TLC), methanol was removed *in vacuo*, 20 the mixture was diluted with water (30 mL), and the neutral components were extracted with ethyl acetate (25 mL x 2). The water layer was acidified with 1 N HCl and the product extracted with ethyl acetate (50 mL x 3). A. (5,7-Difluoro-1-propyl-2,3,4,9-tetrahydro-1H-(carbazol-1-yl))-acetic acid methyl ester.

A mixture of 2,5-difluorophenylhydrazine hydrochloride (10 mmol), 2-propyl-2-(methoxycarbonyl)methylcyclohexanone (Asselin et al *J.Med. Chem.* 19, 787-792 (1976), 11 mmol), and sodium acetate (12 mmol) was stirred in methanol (50 ml) for 0.5 - 4 h at room temperature until reaction was complete (monitored by TLC). The

residue after evaporation of the methanol was redissolved in ethyl acetate (100 ml), washed with 1 N HCl (50 ml), pH 7 buffer (50 ml), brine, and dried over sodium sulfate. Evaporation of the solvent afforded essentially pure hydrazone. The latter was dissolved in glacial acetic acid (20 ml) and after addition of boron trifluoride etherate 5 (10-12 mmol), quickly heated to reflux. Stirring at reflux was continued until there was complete consumption of hydrazone (usually 20-45 min). After cooling, the mixture was quenched with saturated sodium bicarbonate solution (100 ml) and extracted with ethyl acetate (2 x 100 ml). The combined organics were washed with brine and dried over sodium sulfate. The crude material that was obtained after 10 evaporation of ethyl acetate was purified by flash chromatography (2-10 % EtOAc/hexane) and used as such in the next step.
